

## **NOTICE TO NETWORK CUSTOMERS**

APS intends to implement new scheduling and reservation practices for Network Customers. The new practices will involve a Service Request (SR) process for Network Transmission Service, which will be similar to the process currently used for Point-to-Point Transmission Service. Thus, instead of submitting Network Transmission Service requests by spreadsheet, Network Customers will use new Network SRs on OASIS to request each point of receipt and point of delivery combination for Network Transmission Service. The Network customer would then e-Tag the resources over the implemented POR/POD pair using the assigned reference number. Under this process, unscheduled Network Transmission Service would be released as non-firm transmission.

APS currently anticipates making these changes in mid-May 2007 and will provide Network Customers with a test environment or training prior to making the changes.
