

Current Load Forecast Descriptive Statement

The data shown is created by the Santee Cooper load forecast system and is based on proprietary weather information available at the time the forecasts are made.

Santee Cooper uses a neural network methodology combined with industrial customer load forecast. The methodology uses dry bulb temperatures from six key weather sites throughout the state. Other assumptions include the day of the week, applicable holidays, historical system-wide load patterns, weather conditions and forecasts. Weather forecasts are available at: NOAA Weather as well as on commercial websites.
