

A UniSource Energy Company

Tucson Electric Power Company Load Forecast Assumptions

Underlying Load Forecast Assumptions for all ATC Calculations

Effective: 7/13/07

Posted: 07/10/08

TEP Marketing's Native and System wide (TEP + UES) forecasts are based on historical hourly load data and daily high and low temperature data accumulated over the last 3 to 8 years, adjusted for the current week's weather forecast and peak load trend. This generates an expected load value for each hour of the day which resources are then scheduled against.

The 7-Day Forecast is an extension of this procedure based on the NOAA 10 - Day forecast.
